

Technical Test Project

Description

Build a small full-stack application that allows users to find packaged food products by entering a product title or search term. Product information must be retrieved from Open Food Facts through the backend and presented in a clean, responsive interface.

The application must support English, Dutch, German, and French through a manual language selector, with both the interface and product information shown in the selected language where possible.

Everyone can view basic information such as the product name, brand, and image, but detailed nutritional values should only be available when the demo user has an active Stripe subscription.

The assignment should demonstrate how you structure a complete full-stack feature, including external integrations and internationalization. Document important technical decisions and simplifications.

Required Stack

Frontend	Backend
TypeScript	TypeScript
Next.js	Express
React	Prisma
Tailwind CSS	MySQL
	Open Food Facts API
	Stripe subscriptions API (in test mode)

Requirements

- Search for products by title or search term and handle missing or incomplete data.
- Support English, Dutch, German, and French through a language selector.
- Show the interface and product information in the selected language where possible.
- Use one demo user and store recent searches in MySQL.
- Create a monthly subscription using Stripe Checkout.
- Process Stripe webhooks and enforce subscription access in the backend.
- Add several meaningful automated tests.
- Keep secrets in environment variables.

Deliverables

Submit a Git repository containing:

- Source code
- Prisma migration
- .env.example
- Automated tests
- A README with setup instructions, technical decisions, internationalization approach, and known limitations.

Use of AI

AI tools are permitted, but you remain responsible for the submitted code and must be able to explain, debug, and modify it during the review.
